# Data Structures and Algorithms III

Formal languages and automata

Çağrı Çöltekin /tʃaːrˈw tʃœltecˈın/ ccoltekin@sfs.uni-tuebingen.de

> University of Tübingen Seminar für Sprachwissenschaft

Winter Semester 2018-2019

Practical matters Formal languages Languages and Complexity Formal & natural languages

# An overview of the upcoming topics

- Background on formal languages and automata (today)
- Finite state automata and regular languages
- Finite state transducers (FST)
  - FSTs and computational morphology
- Dependency grammars and dependency parsing
- · Context-free grammars and constituency parsing

Ç. Çöltekin, SfS / University of Tübingen WS 18–19

Practical matters Formal languages Languages and Complexity Formal & natural languages

#### This lecture

An overview

- Background: some definitions on phrase structure grammars and rewrite rules
- Chomsky hierarchy of (formal) language classes
- Background: computational complexity
- Automata, their relation to formal languages
- Formal languages and automata in natural language processing
- · A brief note on learnability of natural languages

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Definitions

Alphabet

- An *alphabet* is a set of symbols
- $\bullet$  We generally denote an alphabet using the symbol  $\Sigma$
- In our examples, we will use lowercase ASCII letters for the individual symbols, e.g.,  $\Sigma = \{\alpha, b, c\}$
- Alphabet does not match the every-day use:
  - In some cases one may want to use a binary alphabet,  $\Sigma = \{0,1\}$
  - If we want to define a grammar for arithmetic operations, we may want to have  $\Sigma=\{0,1,2,3,\dots,9,+,-,\times,/\}$
  - If we are interested in natural language syntax our alphabet is the set of natural language words,
    - $\Sigma = \{the, on, cat, dog, mat, sat, \ldots\}$

Practical matters Formal languages Languages and Complexity Formal & natural langu

## **Practical matters**

The second part of the course will be somewhat different:

- The focus will shift more towards Computational Linguistics topics / applications
- We will review more specialized data structures and algorithms (e.g., automata, parsing)
- Some overlap with parsing class (but with more emphasis on practical sides)
- · Less focus on programming

A quick poll: opinions about switching to Python.

Ç. Çöltekin, SfS / University of Tübingen

WS 18-19 1 /

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Assignments

- Assignment policy is similar to the first part of the course
- Two graded assignments:
  - Finite state methods (due early Jan)
  - Parsing (due mid Feb)
- There will be more ungraded assignments they are part of the course work, they are not 'optional'

Ç. Çöltekin, SfS / University of Tübingen

WS 18-19

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Why study formal languages

- Formal languages are an important area of the theory of computation
- They originate from linguistics, and they have been used in formal/computational linguistics

Ç. Çöltekin, SfS / University of Tübingen

WS 18–19 5 / 34

Practical matters Formal languages Languages and Complexity Formal & natural languages

#### Definitions

Strings

- A *string* over an alphabet is a finite sequence symbols from the alphabet
  - a, ab, acbcaa are example strings over  $\Sigma = \{a, b, c\}$
- $\bullet$  The empty string is denoted by  $\varepsilon$
- The  $\Sigma^*$  denotes all strings that can be formed using alphabet  $\Sigma,$  including the empty string  $\varepsilon$
- $\bullet$  The  $\Sigma^+$  is a shorthand for  $\Sigma^*-\varepsilon$
- Similarly  $\alpha^*$  means the symbol  $\alpha$  repeated zero or more times,  $\alpha+$  means  $\alpha$  repeated one or more times
- $\bullet$  We use  $\alpha^n$  for exactly n repetitions of  $\alpha$
- The length of a string u is denoted by |u| , e.g., |abc|=3, or if u=aabbcc , |u|=6
- Concatenation of two string u and v is denoted by uv, e.g., for u = ab and v = ca, uv = abca

Ç. Çöltekin, SfS / University of Tübingen

· A grammar is a finite description of a

· A common way of specifying a grammar is

based on a set of rewrite rules (or phrase

· We represent non-terminal symbols with

• If a string can be generated from S using the rewrite rules, the string is a valid

• We represent terminal symbols with

#### **Definitions**

#### Language

- A (formal) language is a set of string over an alphabet
  - The set of strings of length 2 over  $\{0, 1\}$ : {00, 01, 10, 11}
  - The set of strings with even number of 1's over  $\{0,1\}$ :  $\{\epsilon, 101, 0, 11, 1111110, \ldots\}$
  - The set of string that retain alphabetical ordering over  $\{a,b,c\}$ :
  - $\{a, ab, abc, ac, abcc, \ldots\}$
  - The set of strings of words that form grammatically correct English sentences
- Strings that are member of a language is called sentences (or sometimes words) of the language

Phrase structure grammars: more formally

A phrase structure grammar is a tuple  $G = (\Sigma, N, S, R)$  where

- $\boldsymbol{\Sigma}\$  is an alphabet of terminal symbols
- N are a set of non-terminal symbols
- S is a special 'start' symbol  $\in N$
- R is a set of rules of the form

where  $\alpha$  and  $\beta$  are strings from  $\Sigma \cup N$ 

A string u is in the language defined by G, if it can be derived from S.

Ç. Çöltekin, SfS / University of Tübinger

WS 18-19 10 / 34

Ç. Çöltekin, SfS / University of Tübinger

Regular grammars

Left regular

1.  $A \rightarrow a$ 

 $2. \ A \to B \alpha$ 

3.  $A \rightarrow \varepsilon$ 

Q: What if string was not in the language? Q: Is there another derivation sequence?

Right regular

1.  $A \rightarrow a$ 

3.  $A \rightarrow \varepsilon$ 

 $2. \ A \to \alpha B$ 

• Intermediate strings of terminals and

non-terminals are called sentential forms

•  $S \stackrel{*}{\Rightarrow} abab$ : the string is in the language

Derivation of abab

 $\mathsf{SAB} \Rightarrow \mathsf{ABAB}$ 

 $ABAB \Rightarrow \alpha BAB$ 

 $\mathsf{S} \Rightarrow \mathsf{S}\mathsf{A}\mathsf{B}$ 

Practical matters Formal languages Languages and Complexity Formal & natural langu

· Least expressive, but easy to process

• We will discuss it in more detail soon

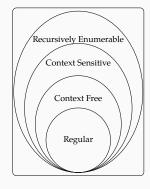

· Used in many NLP applications

WS 18-19 11 / 34

Practical matters Formal languages Languages and Complexity Formal & natural language

# Chomsky hierarchy of (formal) languages

- · Defined for formalizing natural language syntax
- · Definitions are in terms of the restrictions on production rules of the grammar
- Also part of theory of computation
- · Each language class corresponds to a class of (abstract) machines
- · Other well-studied classes exist

Ç. Çöltekin, SfS / University of Tübingen

Ç. Çöltekin, SfS / University of Tübingen

reverse is not true)

WS 18-19 13 / 34

Practical matters Formal languages Languages and Complexity Formal & natural languages

· Defines the set of languages expressed by regular

• Regular grammars define only regular languages (but

# Context-free grammars (CFG)

# CFG rules

 $A \rightarrow \alpha$ 

where A is a single non-terminal  $\alpha$  is a possibly empty sequence of terminals and non-terminals

- More expressive than regular languages
- Syntax of programming languages are based on CFGs
- Many applications for natural languages too (more on this later)

Practical matters Formal languages Languages and Complexity Formal & natural languages

#### Regular grammars an example

Write a right- and a left-regular grammar ab\*c

left	
$S\toAc$	
$A \rightarrow Ab$	
A  o a	
_	

right  $S \rightarrow aA$  $A \rightarrow bA$  $\boldsymbol{A} \to \boldsymbol{c}$ 

Can you define a regular grammar for

- a<sup>n</sup>b<sup>n</sup>?
- α<sup>5</sup>b<sup>5</sup>?

Derive the string abbbc using one of your grammars

 $S \Rightarrow Ac \Rightarrow Abc \Rightarrow Abbc \Rightarrow$  $Abbbc \Rightarrow abbbc$ 

 $S \Rightarrow \alpha A \Rightarrow \alpha b A \Rightarrow \alpha b b A \Rightarrow$  $abbbA \Rightarrow abbbc \\$ 

right

These grammars are weakly equivalent: they generate the same language, but derivations differ

C. Cöltekin. SfS / University of Tübingen

WS 18-19 15 / 34

# Context-free grammars

an example

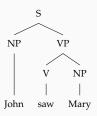

The example grammar:

Example CFG	
$\begin{array}{ccc} S & \rightarrow & NP \ VP \\ NP & \rightarrow & John \   \ Mary \end{array}$	$\begin{array}{ccc} VP & \rightarrow & V \ NP \\ V & \rightarrow & saw \end{array}$

## Exercise: derive 'John saw Mary'

#### Derivation

 $S \Rightarrow NP VP \Rightarrow John VP$  $\Rightarrow$ John V NP  $\Rightarrow$ John saw NP ⇒John saw Mary or, S ⇒ John saw Mary

Ç. Çöltekin, SfS / University of Tübingen

# Context-sensitive grammars

#### Context-sensitive rules

 $\alpha A \beta \rightarrow \alpha \gamma \beta$ 

Practical matters Formal languages Languages and Complexity Formal & natural language

where A is a non-terminal symbol,  $\alpha$  and  $\beta$  are possibly empty strings of terminals and non-terminals, and  $\gamma$  is a non-empty string of terminal and non-terminal symbols.

- There is also an alternative definition through non-contracting grammars
- $\bullet$  A rule of the form  $S \to \varepsilon$  is allowed

Ç. Çöltekin, SfS / University of Tübing

Practical matters Formal languages Languages and Complexity Formal & natural language

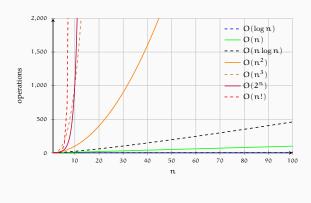

# Unrestricted grammars

- The most expressive class of languages in the Chomsky hierarchy is recursively enumerable (RE) languages
- RE languages are those for which there is an algorithm to enumerate all sentences
- RE languages are generated by unrestricted grammars
- Unrestricted grammars do not limit the rewrite rules in any way (except LHS cannot be empty)
- Mostly theoretical interest, not much practical use

Ç. Çöltekin, SfS / University of Tübinger

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Big-O notation and order of complexity the picture

# Contxt-free languages

more exercises / questions

- Define a (non-regular) CFG for language ab\*c
- Can you define a CFG for a<sup>n</sup>b<sup>n</sup>?
- $\bullet$  Can you define a CFG for  $\mathfrak{a}^n b^n c^n?$
- Can you define a CFG for  $a^nb^mc^nd^m$ ?

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Context-sensitive grammars

an example

- Can you define a context-sensitive grammar for  $\mathfrak{a}^n\mathfrak{b}^n\mathfrak{c}^n$ ?
- Can you define a context-sensitive grammar for anbmcndm?

Ç. Çöltekin, SfS / University of Tübing

Practical matters Formal languages Languages and Complexity Formal & natural language

## A(nother) review of computational complexity Big-O notation

Big-O notation is used for describing worst-case order of complexity of algorithms

O(1) constant

 $O(\log n)$  logarithmic

O(n) linear

 $O(n \log n)$  log linear

O(n<sup>2</sup>) quadratic

 $O(n^3)$  cubic

O(2<sup>n</sup>) exponential

O(n!) factorial

Given T(n), what is O(n)?

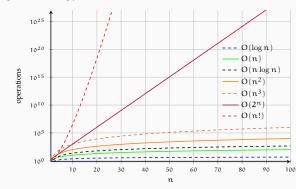

- $T(n) = \log(5n)$
- T(n) = 5n
- $T(n) = n + \log n$
- $T(n) = n^2 + 10$
- $T(n) = n^5 + n^4$
- $T(n) = n^5 + 4^n$
- $T(n) = n! + 2^n$

Ç. Çöltekin, SfS / University of Tübinger

Grammar

Regular

Practical matters Formal languages Languages and Complexity Formal & natural languages

· Context-sensitive languages can be generated using a

· Although decidable, recognition of a string with a

restricted form of Turing machine, called linear-bounded

context-sensitive grammar is computationally intractable

Context-free

Context-sensitive

# A(nother) review of computational complexity P, NP, NP-complete and all that

- A major division of complexity classes according to Big-O notation is between
  - $\,^{\rm P}\,$  polynomial time algorithms  $\,^{\rm NP}\,$  non-deterministic polynomial time algorithms
- A big question in computing is whether P = NP
- All problems in NP can be reduced in polynomial time to a problem in a subclass of NP, (NP-complete)
  - Solving an NP complete problem in P would mean proving P=NP

Turing machines

Practical matters Formal languages Languages and Complexity Formal & natural languages

# RE languages and Turing machines

- Recursively enumerable languages can be generated by *Turing machines*
- Turing machine is an simple model of computation that can compute any computable function
  - A Turing machine manipulates symbols on an infinite tape, using a finite table of rules
- A Turing machine can enumerate all string defined by an unrestricted phrase structure grammar
- The membership problem of RE languages is not decidable

Ç. Çöltekin, SfS / University of Tübinger

Ç. Çöltekin, SfS / University of Tübing

VS 18–19 26 / 34

Practical matters Formal languages Languages and Complexity Formal & natural languages

## Context-free languages and pushdown automata

- Context-free languages are recognized by pushdown automata
- Pushdown automata consist of a finite-state control mechanism and a stack
- Computationally feasible solutions exists for many problems related to context-free grammars
- There are polynomial time algorithms for recognizing strings of context-free languages (we will return to these in lectures on parsing)

öltekin, SfS / University of Tübingen WS 18–19

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Chomsky hierarchy and natural language syntax Where do natural languages fit?

- The class of grammars adequate for formally describing natural languages has been an important question for (computational) linguistics
- For the most part, context-free grammars are enough, but there are some examples, e.g., from Swiss German (Shieber 1985)

Jan säit das...

...mer em Hans es huss hälfed aastriiche
...we Hans (DAT) the house (ACC) helped paint

Note that this resembles  $a^nb^mc^nd^m$ .

Practical matters Formal languages Languages and Complexity Formal & natural languages

## Regular languages and FSA

(PSPACE-complete)

- Regular languages can be recognized using finite-state automata (FSA)
- A FSA consist of a finite set of states with directed edges between them
- Edges are labeled with the terminal symbols, and tell the automation to which state to move on a given input symbol

Ç. Çöltekin, SfS / University of Tübinger

WS 18-19 29 / 34

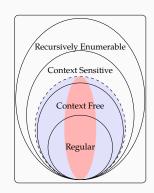

WS 18-19

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Where do natural languages fit? the picture

- Often a superset of CF languages, mildly context-sensitive languages are considered adequate
- Note, though, we do not even need full RE expressivity
- Modern/computational theories of grammars range from mildly CS (TAG, CCG) to Turing complete (HPSG, LFG?)

C. Cöltekin. SfS / University of Tübinger

Ç. Çöltekin, SfS / University of Tübingen WS 18–19 30 / 34

itters Formal languages Languages and Complexity Formal & natural languages

### Learnability natural languages

language acquisition & nature vs. nurture

- A central question in linguistics have been about 'learnability' of the languages
- Some linguists claim that natural languages are not learnable, hence, humans born with a innate language acquisition device
- A poplar theory of the language acquisition device is called principles and parameters
- This has created a long-lasting debate, which is also related to even longer-lasting debate on nature vs. nurture

C. Cöltekin, SfS / University of Tübingen

Practical matters Formal languages Languages and Complexity Formal & natural languages

# Wrapping up

- $\bullet\,$  Formal languages has a central role in the theory of computation, as well as in formal/computational linguistics
- Practically-useful classes of languages in Chomsky hierarchy is regular and context-free languages (we will return to these in more detail)
- Natural language syntax can be described mostly by CFGs

Finite state automata

# Formal languages and learnability

- Some of the arguments in the learnability debate has been based on results on formal languages
- It is shown (Gold 1967) that none of the languages in the Chomsky hierarchy are learnable from positive input
- · The applicability of such results to human language acquisition is questionable
- Computational modeling/experiments may help here (another job for computational linguists)

Ç. Çöltekin, SfS / University of Tübinger

# References / additional reading material

- · The classic reference for theory of computation is Hopcroft and Ullman (1979) (and its successive editions)
- Sipser (2006) is another good textbook on the topic
- A popular nativist account of language acquisition debate is Pinker (1994)
- A popular non-nativist (somewhat empiricist) book on language acquisition is Clark and Lappin (2011), which also covers discussion of (Gold 1967) and later work
