introduction Operations on FSTs Determinizing FSTs Summar

#### Formal definition

A finite state transducer is a tuple  $(\Sigma_i, \Sigma_o, Q, q_0, F, \Delta)$ 

 $\Sigma_i$  is the *input* alphabet

 $\Sigma_o$  is the *output* alphabet

Q a finite set of states

 $q_0$  is the start state,  $q_0 \in Q$ 

 ${\sf F}\,$  is the set of accepting states,  ${\sf F}\subseteq {\sf Q}\,$ 

 $\Delta$  is a relation (  $\!\Delta: Q \times \Sigma_i \to Q \times \Sigma_o \!$  )

Introduction Operations on FSTs Determinizing FSTs Summary

#### Where do we use FSTs?

example 1: morphological analysis

In this lecture, we treat an FSA as a simple FST that outputs its input: edge label 'a' is a shorthand for 'a:a'.

Ç. Çöltekin, SfS / University of Tübingen

Introduction Operations on FSTs Determinizing FSTs Summary

#### Closure properties of FSTs

Like FSA, FSTs are closed under some operations.

- Concatenation
- Kleene star
- Complement
- Reversal
- Union
- Intersection
- $\bullet \ \ Inversion$
- Composition

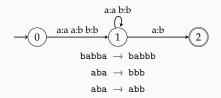

#### Finite state transducers

A quick introduction

• A *finite state transducer* (FST) is a finite state machine where transitions are conditioned on a pair of symbols

tion Operations on FSTs Determinizing FSTs Summary

- The machine moves between the states based on input symbol, while it outputs the corresponding output symbol
- An FST encodes a *relation*, a mapping from a set to another
- The relation defined by an FST is called a *regular* (or *rational*) relation

Ç. Çöltekin, SfS / University of Tübingen

WS 18-19 1 /

## Introduction Operations on FSTs Determinizing FSTs Summary Where do we use FSTs?

Uses in NLP/CL

- Morphological analysis
- Spelling correction
- Transliteration
- · Speech recognition
- Grapheme-to-phoneme mapping
- Normalization
- Tokenization
- POS tagging (not typical, but done)
- partial parsing / chunking

• ...

Introduction Operations on FSTs Determinizing FSTs Summar

#### Where do we use FSTs?

example 2: POS tagging / shallow parsing

Note: (1) It is important to express the ambiguity. (2) This gets interesting if we can 'compose' these automata.

WS 18–19 5 / 17

Introduction Operations on FSTs Determinizing FSTs Summary

#### FST inversion

- Since FST encodes a relation, it can be reversed
- $\bullet\,$  Inverse of an FST swaps the input symbols with output symbols
- $\, \bullet \,$  We indicate inverse of an FST M with  $M^{-1}$

Ç. Çöltekin, SfS / University of Tübingen WS 18–19 6 / 17

## Introduction Operations on FSTs Determinizing FSTs Summary

#### FST composition

sequential application

		$M_1 \circ M_2$		
aa	$\xrightarrow{M_1}$	bb	$\xrightarrow{M_2}$	bb
bb	$\xrightarrow{M_1}$	Ø	$\xrightarrow{M_2}$	Ø
aaaa	$\xrightarrow{M_1}$	baab	$\xrightarrow{M_2}$	baac
abaa	$\xrightarrow{M_1}$	bbab	$\xrightarrow{M_2}$	bbac

• Can we compose without running the FSTs sequentially?

Ç. Çöltekin, SfS / University of Tübingen

WS 18–19 9 / 17

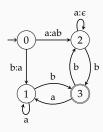

#### FST determinization

- A deterministic FST has unambiguous transitions from every state on any *input* symbol
- We can extend the subset construction to FSTs
- Determinization often means converting to a *subsequential* FST
- However, not all FSTs can be determinized

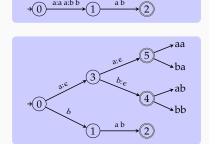

#### Sequential FSTs

- · A sequential FST has a single transition from each state on every input symbol
- · Output symbols can be strings, as well as  $\epsilon$
- The recognition is linear in the length of input
- However, sequential FSTs do not allow ambiguity

#### An exercise

Convert the following FST to a subsequential FST

tion Operations on FSTs Determinizing FSTs Summary

Ç. Çöltekin, SfS / University of Tübin

#### FSA vs FST

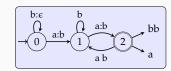

- $\bullet\,$  FSA are acceptors, FSTs are transducers
- FSA accept or reject their input, FSTs produce output(s) for the inputs they accept
- FSA define sets, FSTs define relations between sets
- FSTs share many properties of FSAs. However,
  - FSTs are not closed under intersection and complement
  - We can compose (and invert) the  $\ensuremath{\mathsf{FSTs}}$
  - Determinizing FSTs is not always possible
- Both FSA and FSTs can be weighted (not covered in this course)

  - Mohri (2009): weighted FSTs

#### Subsequential FSTs

- A k-subsequential FST is a sequential FST which can output up to k strings at an accepting state
- Subsequential transducers allow limited ambiguity
- · Recognition time is still linear

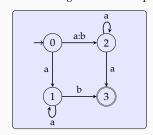

- The 2-subsequential FST above maps every string it accepts to two strings, e.g.,
  - $baa \rightarrow bba$
  - baa  $\rightarrow$  bbbb

Introduction Operations on FSTs Determinizing FSTs Summary

#### **Determinizing FSTs**

Another example

Can you convert the following FST to a subsequential FST?

Note that we cannot 'determine' the output on first input, until reaching the final input.
